With the help of writer Rothstein, urology professor Goldstein has produced this work focusing on male impotence (the title may mislead) with an emphasis on the interacting effects of psychological and physiological problems. The work is told from the physician’s perspective, with illustrative anecdotes and examples drawn from cases. While certainly not as accessible as Eileen and Bruce MacKenzie’s It’s Not All in Your Head (JJ 4/15/88), this nonetheless has the same self-help approach as Steven Morganstern’s Love Again, Live Again (Prentice Hall, 1988). Except for the brief section on the future, this work has nothing new to add to the many current works on the topic. If, however, your collection lacks a current work on impotence, this title would be a good addition.—Robert Aken, Univ. of Kentucky Libs., Lexington

Greene, A.C. Taking Heart.
This Texas writer received a heart transplant in his early 60s as his own heart progressively deteriorated. His account of his experiences—the shock of knowing he was dying, the anxiety of waiting for a suitable heart replacement, the physical and emotional trauma of the transplant itself—is high drama, yet it is also accompanied by a good, clear exposition of the medical art and science involved. Not all transplant patients have made as successful a transition to a new mode of living as Greene seems to have done; thus part of the appeal of his book is an upbeat philosophy that has evidently sustained him through an extremely stressful period in his life. Obviously, those facing similar problems would find this a helpful book, but it is also recommended to all general readers for the story itself.—Eleanor Muass Associates, New Milford, Pa.

Gross, Amy & Dee Ito.
Women Talk About Breast Surgery.
This book’s positive philosophy should help encourage women facing breast surgery to take an active role in determining the course of treatment. The book begins with brief descriptions of available treatments, ranging from lumpectomy to total mastectomy, including radiation, chemotherapy, and reconstructive surgery, and a glossary of terms is provided. The bulk of the book consists of interviews, reproduced in a loose question-and-answer format, with women who have had these procedures and with physicians specializing in various forms of treatment. Most interviews probably already have a number of titles on the subject, but if there is a need for further material, this book offers a unique approach and is well organized. A complementary book is Deborah H. Kahan’s No Less a Woman: Ten Women Tell the Truth About Breast Cancer. LJ 5/15/90, inspirational first-person stories of breast cancer survivors.—Ed J—Deborah Emerson, Monroe Community Coll. Lib., Rochester, N.Y.

Gutkind, Lee. One Children’s Place: A Profile of Pediatric Medicine.
The Children’s Hospital of Pittsburgh is the setting of this dramatic, well-written study of political and human dynamics in a pediatric hospital. Science writer Gutkind examines the roles of health-care professionals and staff and their relationships with patients and families. He also explores the ethical dilemmas posed by the technological advances of organ transplantation, neonatal life-support, and other medical procedures, all startling reminders of the progress pediatric care has made over the last century. Central to the book, however, are the human relationships and emotions experienced on a daily basis. Gutkind
BEAT the O.P. BLUES

HAVE YOU BEEN MISSING OUT on utilizing the world’s most effective o.p. booksearch network? Time-tested, reliable and trustworthy, it has been connecting librarians with books since 1948.

AB Bookman’s Weekly is well known as the standard of the book trade. And now AB makes it even easier with Automated BookmanSM, its newly-developed computerized network.

Computerization can enhance the speed and lessen the work involved with finding o.p. books. BUT IT CANNOT TAKE THE PLACE OF A KNOWLEDGEABLE BOOKSELLER SERVING LIBRARIANS WITH A TRUSTWORTHY NETWORK BACKING IT ALL UP.

Automated BookmanSM will now speed up the process.

AB connects the thousands of booksellers who literally have millions of books stashed all over the country in barns, warehouses, attics and shops. There is no database that can compete with that.

Beat the o.p. blues. It’s a simple fact that there are more out-of-print books than in print, including those that were published only last season, but are now already out of print. And most o.p. books are still available.

For librarians who need to replace their well-loved classics, their much-in-demand regional titles, fulfill the book requests of faculty members, or complete their special collections, the anti- aturian bookseller affiliated with AB can be a real partner.

"Out-of-stock-indefinitely" is not part of their vocabulary.

Connect with the thousands of anti- quarian booksellers and their millions of books through the dynamic combination of AB Bookman’s Weekly and Automated BookmanSM.

It’s an unbeatable, full-service combination.

If you are planning to move to Chicago, be sure to drop by Booth #1088. See demonstrations of Automated BookmanSM and pick up free copies of AB’s special issues. Enter our drawing for a free subscription or a "Books Woman" T-shirt. First-time subscribers when mention- ing this ad will receive a 20% discount (offer expires August 1, 1990). Pick up a brochure on the Denver O.P. Market Seminar.

SCIENCE & TECHNOLOGY

avoids sensationalism and presents an honest, thorough, and moving portrayal of hospital life. Highly recommended for academic and public libraries. —Mary Hemmings, Univ. of Calgary Lib., Alberta

Neustaedter for the most part is against routine immunization. His book is intended to provide parents with information about childhood diseases, vaccines, and safety and legal requirements so they don’t just “blindly accept the opinions of doctors.” However, there are many national, state, and local laws that make some immunizations mandatory, whether parents like it or not. Still, this book helps inform parents about the subject, and pub- lic libraries should consider it for purchase as alternative, often controversial reading on this important topic.—Barbara J. Do- herty, Evanston Hosp. Lib., Ill.

Epilepsy, a common chronic disorder, is characterized not only by recurrent sei- zures, but also by lifelong medical and psychosocial complications. People with epilepsy are not homogeneous; medically they present a disorder of infinite variety, and unfortunately they may face formi- dable problems. Richard, who has controlled her seizures without drugs for 15 years, and Reiter, a neurologist, suggest medical and self-help techniques that can help ease or control suffering, including biofeedback, psychotherapy, nutrition, relaxation, exercise, stress reduction, and journal keeping. The authors also rightly note that these suggestions do not replace professional health services. Recom- mended for consumer health collections.—James Swanton, Albert Einstein Coll. of Medicine Lib., Bronx, New York

IBD (Inflammatory Bowel Disease) is an umbrella term for serious disorders of the large intestine, including Crohn’s disease and ulcerative colitis. Nutrition is import- ant in managing these chronic diseases, and nutritional biologist Scala’s recommen- dations seem sensible. Unfortunately, the title—Eating Right for a Bad Gut—and promotional material for this book confuse IBD with the less serious and more common condition called IBS (Irritable Bowel Syndrome), which Scala does not address at all. Such imprecise wording might lead to extreme anxiety in the unwary reader looking for information on indigestion.—Evelyn L. Mott, Palm Beach Cty. Lib., West Palm Beach, Fla.

Hypnotherapist Scholl’s eight-week program for vision improvement combines self-hypnosis with “Bates method” self- help vision exercises. Clearly a New Ager (she believes she has regressed clients to past lives), Scholl is convinced that many can experience dramatic improvement by following her plan, although, to her credit, it avoids sensational promises of per- fect vision. The program is described in detail and includes scripts which can be taped for regular use. This trendy book might capture the interest of aging boomers lately encountering vision prob- lems, but it will not be a necessary acquisi- tion, except for libraries with comprehensive alternative health collections.—Judith Euannarino, George Washington Univ. Lib., Washington, D.C.

Tauman’s thesis is that infant colic syn- drome is a treatable, preventable problem. He discusses causes of colic and stresses its communication basis, calling colic an “acoustical umbilical cord.” Adults often misinterpret the message of an infant’s cry- ing, says Tauman, and this can create agitation and frustration for the baby. Cit- ing case studies, Tauman provides various systematic solutions, including keeping a daily diary, to help parents succeed in stopping each specific crying epi- sode. Of other books on this topic, Sheila Kitzinger’s The Crying Baby (LJ 4/15/89) relies more on in-depth research and interviews, and Marc Weissbluth’s Cribbabies (LJ 6/15/84) is esoteric and complex. This book provides a more useful, direct approach. Highly recommended.—Janet M. Coggon, Univ. of Florida Lib., Gainesville

Advances in fertility management are outlined in this clear, consumer-oriented book. Basic reproductive principles are reviewed, as are the causes and treatment of infertility. Criteria for selecting infertility clinics and programs are especially well detailed. Guidelines for prenatal care, parti- cularly for surgical implant recipients, are
