Research suggests that droughts will become longer, more severe, and a more frequent scourge on the prairies in coming years. Although there is considerable literature describing the social and economic impact of drought on the prairies in the 1930s, few books have addressed the ravages of recent droughts. *Vulnerability and Adaptation to Drought* examines the social forces, technological innovations, and information networks that can enhance resilience to drought. Examining drought in Canada and South America, this interdisciplinary collection brings together climate science and social science to explore the conditions generating these challenges, and to offer insight into how prairie communities can reduce their vulnerability to drought, including examples of successful adaptation strategies.

Harry Diaz is a Professor of Sociology and Social Studies and former Director of the Canadian Plains Research Center (CPRC) at the University of Regina. His fields of research include adaptation and vulnerability to climate change, water scarcities, and environmental governance. He has participated in several projects dealing with the impacts of climate on the rural sector in Canada and Latin America.

Margot Hurlbert is an Associate Professor jointly appointed in the Department of Justice Studies and Department of Sociology and Social Studies at the University of Regina. Her fields of research include adaptive governance, the water – energy – food nexus, social learning, and community engagement. She has participated in several projects dealing with the impacts of climate and institutional governance in Canada and Latin America.

Jim Warren is a policy and communications consultant specializing in water governance and management issues. He lectures in environmental sociology and management communications at the University of Regina.
