Enhancing Course Development Through Conversations

Brian Tidbury Gilbert, Dr. Amanda Musgrove-Richer, and Dr. Nicole Sandblom Department of Chemistry

Introduction

As many undergraduates in the Faculty of Science know, the unit on buffer systems in first year chemistry is one of the toughest parts of the course. However, despite this difficulty being commonly seen, there is still a large gap in the literature on the teaching and learning of buffer systems¹. Due to the gap in literature about teaching buffer systems, this undergraduate research project built upon the work of Orgil and Sutherland² and looked to determine if there really is a statistical backing to the claims of difficulty with buffer systems, determine why such a difficulty exists, and attempt to address the observed issues through the implementation of a learning simulation.

Results

A simulation was built in the JavaTM programming language following the guidelines³ set out by the PhET group in order to maximize the educational benefit to students. Each component was designed to address a specific misconception observed during the study. After implementing the simulation into the lectures and buffer tutorials, students were better equipped to answer buffer related questions and were stronger in their understanding of buffer phenomena.

Conclusions

Based on course performance and student feedback, students are now more equipped to succeed in introductory chemistry and are leaving the course with a much deeper understanding of course content. In moving forward from this research, we would recommend implementing simulations and demonstrations into post-secondary classrooms to help students grasp complex/abstract concepts in the sciences.

Special thanks to the Schulich School of Engineering for funding our various help throughout this project, the entire CHEM209 teaching team for running with the many changes made to the course as a result of this project, to the Department of Chemistry in the Faculty of Science for approving parts of this project as CHEM402.01 and CHEM402.02 projects, and to the Natural Sciences program in the Faculty of Science for approving a part of this project as a SCIE507 project. The University of Calgary Conjoint Faculties Research Ethics Board has approved this research study as REB15-3014, REB15-3014_MOD1, AND REB16-1085

Experimental Approach

Tutorial grade analysis. Tutorial grades analyzed to determine most difficult concept in introductory chemistry

back to School

Prior knowledge assessments. Students to recall information and skills from high school chemistry prerequisites

feedback from students about newly implemented resources

Misconception cards. Identified the reasons that students have difficulty in the topics identified during the first focus group

Buffer simulation/visual aid

- overload
- simulation
- Reaction included to connect buffer function to the reactions learned in lecture Universal indicator slider included to visually connect simulation to laboratory and inclass demonstration experiences
- Component bars included to visually represent the mechanisms that work to buffer the pH in solutions when strong acid or base are added
- Titration curve included for students to have a familiar visual about buffer systems to relate all other components to.
